# NAAN MUDHALVAN-NIRAL THIRUVIZHA

## *AI-based Clinical Decision & Therapeutic Support System*

## MAJORAREA: HEALTH/DEEPTECH

## KEY FINDINGS

Real-time conversations help in identifying early signs of stress, anxiety, and mood changes. Users feel more comfortable sharing emotions with AI due to anonymity. Emotion-aware responses improve user engagement and trust. The chatbot can accurately detect user emotions using NLP models (like BERT-based classification). Continuous interaction helps in tracking emotional patterns over time.

## PROJECT CONTRIBUTE TO EXISTING KNOWLEDGES OR ADDRESSES REAL-WORLD CHALLENGES

Bridges the gap between **technology and emotional well-being**. Provides **accessible mental health support** for users who hesitate to seek professional help. Helps in **early detection of mental health issues**, reducing risk of severe conditions. Can be integrated into **websites, apps, and student platforms** for wide reach. Reduces dependency on immediate human intervention for basic emotional support.

## HIGHLIGHTS

**Emotion Detection System** – Identifies user feelings from text input.
**AI-Powered Conversations** – Uses NLP for intelligent and human-like replies.
**Memory-Based Interaction** – Remembers past conversations for better support.
**Multi-Emotion Classification** – Detects multiple emotional states (not just positive/negative).
**Safe & Private** – Ensures user confidentiality.
**Real-Time Response** – Instant emotional assistance anytime.

## DEVELOPED SYSTEM
